DATA SHEET CONFIDENTIAL

# **General Description**

The AS3510 combines high flexibility and outstanding performance for analog audio front-end solutions.

This codec-chip contains a high performance 18 bit digital to analog converter. The dynamic range exceeds 95dB for best audio quality, for multi media applications (audio playback) within battery or line operated equipment.

An additional audio power amplifier can directly drive external headphones or small  $4\Omega$  speakers with a power of up to half a watt. The power-up is click- and pop-less due to a smooth start-up circuitry. The overall distortion level is always below 0.02%.

The microphone input amplifier contains an automatic gain control (AGC) with a dynamic range of 40dB to generate an amplified and compressed signal for the ADC, which provides 14 Bit resolution at 8kHz sampling-rate.

Furthermore all necessary power management is included such as bandgap reference and four voltage regulators. The two 2.9V regulators are used internally (analog and digital supply), but can also be used for external purposes as well. The third output is designed to supply the peripheral cells and an external digital core, and is programmable from 1.5V to 2.5V in 5 steps (default is 2.5V). They are all powered through a DCDC-Converter, which can work down to a voltage of 1V. So the whole chip can work from a single battery cell.

The fourth regulator is only used for generating the supply voltage for the analog USB 1.1 interface circuit. It is supplied via the USB connector. The performance of the regulators is excellent (noise, line- and load-regulation) and allows the direct supply of sensitive analog circuits.

Because of the internal supply and signal filtering only few small external capacitors are required for de-coupling and stabilising and lead to very low output noise.

The current consumption is very low and makes the chip ideally for battery powered devices.

# **Key Features**

#### On chip DCDC Converter

- 1.0 to 5.5V input voltage range

#### 4 On-chip high performance voltage regulators

- Digital Supply, 2.9V
- Analog Supply, 2.9V
- Core Supply, 1.5 to 2.5V
- USB Transceiver Supply, 3.2V

#### 18 Bit stereo DAC

- Dynamic range >95 dB
- THD < -85dB
- De-emphasis for 32 kHz, 44.1 kHz and 48 kHz

### Stereo power audio amplifier

- Max. 2x 0.5W @ 4Ω
- Analog volume control –39dB to +3dB, 3dB steps including mute)
- Click- and pop-less startup and power down
- Auxiliary inputs for additional audio sources

### Microphone input

- 14 Bit  $\Sigma\Delta-\mathsf{ADC}$  , 8kHz sampling rate
- Automatic gain control (AGC)
- Low power consumption
- Wide battery supply range 1.0V 5.5V
- Standard I2S interface
- Audio sampling rates: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, and 48 kHz
- I2C control interface
- USB 1.1 front-end
- 49 Pin BGA Package

# **Applications**

- Audio frontend for cellular phones
- Stand alone MP3 player
- CD and DVD player
- PDAs

# **Block Diagram**

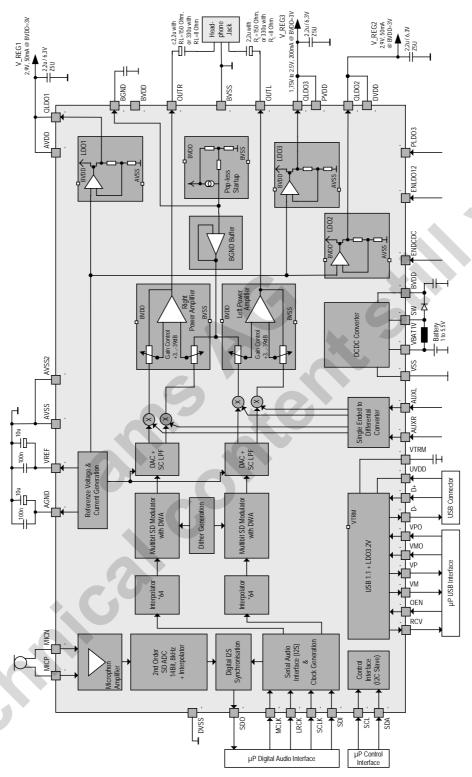

Figure 1 Block Diagram of AS3510

# **Modes of Operation**

	Inp	uts	Out	tputs
LDO-Modes	ENLDO12	ENLDO3	DVDD, AVDD	PVDD
OFF	L	L	LDO1, LDO2 are OFF	LDO3 is OFF
			2.8-3.6V supply fr. Ext.	1.75-3.6V supply fr. Ext.
ON_12	Н	L	LDO1, LDO2 are ON	LDO3 is OFF
			Output is 2.9Vtyp	1.75-3.6V supply fr. Ext.
			or connected to DVI	
ON_123	Н	Н	LDO1, LDO2 are ON	LDO3 is ON
			Output is 2.9Vtyp Output 2.5Vtyp	

Table 1 LDO Operating Modes

#### Nodes:

- 1. BVDD as input to the LDO regulators has to be >=3.0V.
- 2. DVDD AVDD max. difference of 100mV.
- 3. PVDD has to be lower or equal to DVDD.
- 4. LDO1 is to be used for regulating AVDD (connect pin 25 to pin 26)
- 5. LDO2 output is internaly connected to DVDD (pos. digital supply)
- 6. LDO3 output is internaly connected to PVDD (pos. peripheral supply)

DAC-Modes		Inputs		Outputs
	DACPD	128	Gain3:0	OUTR, OUTL
OFF	Н	X	LLLL	TriState
DAC_ON	2	LRCK up to 50kHz  MCLK 128*F(LRCK)  SCLK L=>H strobes SDI  SCLK >=38*F(LRCK)  SDI left justified with MSB first at 2nd SCLK edge	LITTL	TriState
AUDIO_ON	L	LRCK up to 50kHz  MCLK 128*F(LRCK)  SCLK L=>H strobes SDI  SCLK >=38*F(LRCK)  SDI left justified with MSB first at 2nd SCLK edge	LLLH · · HHHH	Stereo audio output with PowerAmp gain adjusted in 3dB steps by GAIN(3:0)

Table 2 DAC Operating Modes

### Nodes:

- During supply voltages settling at system start-up GAIN(3:0) should be held "L".
- The MCLK frequency ratio to LRCK is permanently checked. If the ratio is different to 128, the DAC goes in Reset-Mode (no audio will betransferred).
- MCLK rising edge should not be within +/-10ns of LRCK edges.
- Capacitors at VREF, AGND and BGND are needed for the DAC operation.
- The SCLK has to have at least 34 or 38 cycles within one LRCK cycle
  - $2^*$ (16bit data + the leading empty bit) or  $2^*$ (18bit data + the leading empty bit)
- There can be more SDI bits presented but just the first 18 bits are transferred.

ADC-Modes	ENADC	Inputs I2S-Clocks LRCK, SCLK,MCLK	MICP/MICN	Output SDO
OFF	L	Х	Х	static L
ADC_ON	Н	LRCK up to 50kHz  MCLK 128*F(LRCK)  SCLK >=34*F(LRCK)	Differential analog input to be converted to digital output	SDI serial data output  Ieft justified to LRCK with  MSB first at 2 <sup>nd</sup> SCLK  edge

Table 3 ADC Operating Modes

#### Nodes:

- There are 16bit presented at SDO at each cycle but just the first 14 do have relevalt data.
- The ADC is a single channel (mono) path. The same SDO bitstream is presented for left and right channel of one cycle.
- The ADC sampling rate is equal to LRCK/4. This means that the SDO bitstream gets updated at each 4th cycle of LRCK.
- SCLK has to have at least 34 cycles within one LRCK cycle 2\*(16bit data + the leading empty bit)

# **Functional Description**

#### Audio DAC

#### **Block Description**

This block is the complete audio DAC delivering 93dB dynamic range. It is comprised of a multibit sigma-delta modulator with dither option and a switched-capacitor analog filter. This architecture provides a high insensitivity to clock jitter. A digital interpolation filter increases the sample rate by a factor of 8 using 3 linear phase, half-band filters cascaded, followed by a first order SINC interpolator with a factor of 8. This filter eliminates the images of baseband audio remaining only the image at 64\* the input

sample rate. Optionally, a dither signal can be added that may reduce eventual noise tones at the output. However, the use of a multibit delta-sigma modulator already provides extremely low noise tone energy.

# **Signal Description**

Setting **DACPD** to '1' forces the analog section to power-down. For Normal-Operation the I2S signals have to be applied as shown below:

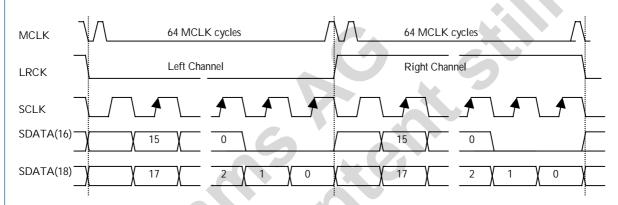

Figure 2 I2S Waveforms

The LRCK defines if the transferred data is for the left or right channel (L=left).

With the rising edge of the serial clock **SCLK**, the inputdata gets strobed.

The data word at **SDATA** is max. 18 bit with MSB first and 2<sup>nd</sup> complement coded. All I2S signals change state with falling edge of SCLK.

code	hex value
Max. positive code	1FFFF (hex)
+1	00001 (hex)
0	00000 (hex)
-1	3FFFF (hex)
Max. negative code:	20000 (hex)

Table 4 I2S Code Values

If the dataword length is less than 18 bit, zeros have to be added to avoid any offset value.

The frequency of master clock MCLK has to be 128 times the input sample rate (F(LRCK)\*128) with low jitter. The rising edge of MCLK should be separated by >10ns from LRCK edges.

There are 2 pins needed for the generation and decoupling of reference-voltages for the DAC. **AGND** is AVDD/2 and **VREF** is equal to AVDD. Both pins have high output resistance which provides a suitable lowpass filter for these reference voltages with external capacitors of 10uF in parallel with 100nF.

The supply lines are separate for digital DVSS / DVDD and analog AVSS / AVDD to minimise coupling influences.

The analog output is differential stereo signal at nodes OUTRN, OUTRP and OUTLN, OUTLP respectively.

#### Control Interface

The interface is a standard I2C slave interface (write only). The system uses address group 8 address 41h for audio-processors. The following table shows the various control options.

Byte 0 (default value: 0x80h)

Bit	Name	Description
7	DITH	dither enable
		1: enable (default) 0: disable
65	DacON	11: Audio DAC is switched on 10: Audio DAC is switched on 01: Audio DAC is switched off 00: automatic mode, DAC is on only when I2S interface is active
4	LP4/16	audio amplifier load switch 1: low power mode for speakers with more than 16 Ohm. 0: normal mode, 4 Ohm loads possible
30	Gain	gain settings for audio amplifier from -39dB to +3dB in steps of 3dB 1111: full output swing: +3dB 1110: 0dB 0010: -36dB 0001: minimum output swing: -39dB 0000: mute

Table 5 - Software I2C Byte 0

		0: also less than 18 bit can be sent
		to the I2S interface and are shifted
		internal

Table 8 - Software I2C Byte 3

### Power Amplifier

#### **Block Description**

The Power Amplifier Block converts the differential output signals from the AudioDAC into single ended signals with the drive capability for impedances ≥4 ohms.

With the conversion from differential to single ended, the transformation of DC level from AGND (=AVDD/2) to BGND (=BVDD/2) is done. The gain of this driver stage can be set by 4 digital input signals in the range from -39dB to +3dB in steps of 3dB. With the maximum gain of +3dB, full scale gives 4.95Vpp at the single ended output.

With I2S data giving full-scale swing, clipping will occur with the max. gain-step. With min. BVDD of 3.0V the same is true for the two highest gain-steps.

When the control signals Gain(3:0) are all set to "L", the block is set to power-down.

There is a BGND generation, which needs an external capacitor of 100nF for blocking of low frequency components at BVDD. With this external capacitor, a so called "Klickless On" is performed so that at power-up, the output terminals have a smooth startup to avoid any transient noise in the headphone.

	G	ain		Gain	FS Swing		Gá	ain		Gain	FS
	(3	:0)		dif <b>→</b> se			(3)	:0)		dif <b>→</b> se	Swing

Table 9 Table of Gain Steps

# Supply Regulator

#### **Block Description**

This block can be used to provide three regulated supply voltages for the

- on\_chip digital section
- on\_chip analog section
- external circuit (uP, DSP...)

from the battery supply BVDD which is directly used by the power\_amplifier.

The **LDO1** and **LDO2** do have the capability to drive 50mA with a voltage drop of <=50mV (10hm). Since the nominal output voltage for these LDOs is 2.9V (+/-50mV), a regulation can be done with BVDD as low as 3.0V.

The **LDO3** is used to generate a supply voltage PVDD for the peripheral cells and external digital circuits, which are controlling the inputs of the AS3510. The drive capability is ≥200mA with a BVDD≥3V.

The maximum output currents for these LDOs can be calculated using the following equation:

$$I_{\text{max}} = \frac{(BVDD - (Vout + 50mV)}{1Ohm}$$

Vout is 2.9V for LDO1 and LDO2. The output Voltage for LDO3 can be programmed via the PLDO3 pin.

PLD3 pin	QLDO3 voltage
VSS	2.25V
150k to VSS	2.0V
open	2.5
150k to DVDD	1.5
DVDD	1.75

Table 10 LDO3 Programming

There are two pads at each LDO, one is the LDO output pad and the second is the corresponding chip supply pad, which are bonded to the same pin (LDO1 only), and have external blocking caps (Cblock with low ESR).

If supply should not be generated from the on\_chip LDOs, these blocks can be disabled with control pin **PowerUP**. AVDD, DVDD and PVDD can then be forced from external regulators.

### Microphone Path

#### **Block Description**

This block converts a differential microphone signal into digital and does a synchronisation to the DAC I2S input clocks. The SigmaDelta converter clock gets derived from MCLK. For LRCK=32kHz → MCLK=4.096MHz, the SD\_CLK is 1.024MHz which gives with decimation to 14 bit a sampling rate of 8kHz. Since the I2S signals for the DACpath is 4 times higher, each ADC-output-code will be presented 4 times in both channels (left, right) the same.

For LRCK=48kHz → MCLK=6.144MHz, the ADC conversion rate will be 12kHz. Due to this synchronisation the transfer of the ADC data is possible with just one extra digital output pin which makes the digital interface very efficient.

The microphone amplifier can be programmed to three different gain values 28dB/ 34dB/ 40dB to adjust the circuit to the used microphone. The microphone amplifier includes a softclip function that reduces the gain when the input voltage range of the ADC is violated.

The fullscale ADC input range is 1.157Vp differential with AVDD=2.9V.

The softclip references are +/-0.434V which gives a useable ADC-range of 0.868Vp differential. This gives a nominal mic input voltage range of 34.72 / 17.36 / 8.68mVp or 24 /12 / 6mVrms for the three micamp gain settings.

SoftClip is done with 15 steps of -1dB.

## Mechanical Dimensions for CABGA 49

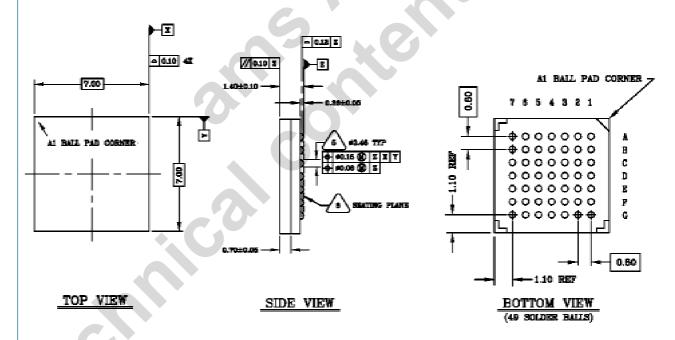

Figure 6 Mechanical Dimensions

# **Abbreviations**

ADC analog to digital converter

AGC automatic gain control

DAC digital to analog converter

dBFS dB full scale

DSP digital signalling processor
ENOB effective number of bits
ESD electrostatic discharge

I2S inter IC sound
LDO low drop regulator

PDA personal digital assistance
PSRR power supply rejection ratio
SFDR spurious free dynamic range

SD sigma delta

SNR signal to noise ratio

SINAD signal to noise and distortion (=THD+N)

TA ambient temperature
THD total harmonic distortion

uP microprocessor

 $\Sigma\Delta$  sigma delta

# Ordering Information

Number	Package	Description
AS3510	LQFP 80	Thin Quad Flat Pack - 80
		leads (evaluation only)
	CABGA 49	ChipArray Ball Grid Array – 49
		balls, 0.8mm pitch

Devices sold by austriamicrosystems AG are covered by the warranty and patent identification provisions appearing in its Term of Sale. austriamicrosystems AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. austriamicrosystems AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with austriamicrosystems AG for current information. This product is intended for use in normal commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by austriamicrosystems AG for each application.
