

# AS3543 DataSheet

# High End Stereo Audio Codec with System PMU

# 1 General Description

The AS3543 is an ultra low power stereo audio codec and is designed for Portable Digital Audio Applications.

It allows high-end quality playback with up to 100dBA SNR and recording in FM quality. With one microphone (including pre-amplifier and supply for an electret microphone) and two line inputs, it allows connecting a variety of audio inputs. The different audio signals can be mixed via a 6-channel mixer and fed to either a headphone output for 16 /32 headsets or a line output. Both outputs have a ground noise cancellation to use it e.g. in car docking stations. The audio outputs have also an auto fading implemented which performs the fade-in, fade-out as well as the transition between specific volume levels automatically with an selectable timing.

Further the device offers advanced power management functions. All necessary ICs and peripherals in a Digital Audio Player are supplied by the AS3543. It features 2 DCDC converters for core and memory/periphery supply as well as 4 LDOs. Both DCDC converter feature DVM (dynamic voltage management) with an selectable timing for the voltage stepping. The different regulated supply voltages are programmable via the serial control interface.

The step-up converter for the backlight can operate up to 15V (with an external transistor even higher) in voltage and current control mode. An internal voltage protection is limiting the output voltage in the case of external component failures. 2 high voltage current sinks can be used to operate two, if needed also unbalanced, LED strings. An automatic dimming function allows a logarithmic on/off of the backlight with selectable timing.

AS3543 also contains a Li-Ion battery charger with constant current, constant voltage and trickle charging. The maximum charging current is 460mA. An integrated battery switch is separating the battery during charging or whenever an external power supply is present. With this switch it is also possible to operate with no or deeply discharged batteries.

The AS3543 has an on-chip, phase locked loop (PLL) which generates the needed internal CODEC master clock. I2S Frame and shift-clock have to be applied from the processor for playback and recording.

Further the AS3543 has an independent 32kHz real time clock (RTC) on chip which allows a complete power down of the system CPU while only consuming less than  $1\mu A.$  An internal switch automatically switches between the RTC backup-battery and main battery supply.

The single supply voltage may vary from 2.7V to 5.5V.

# 2 Key Features

#### **Audio**

#### Audio power consumption:

- - 5mW: 96dB DAC to Headphone @ 1.8V, 32Ω
- - 7mW: 100dB DAC to Headphone @ 2.9V, 32Ω

#### Sigma Delta Converters

- DAC
  - 98dB SNR ('A' weighted) @ 1.7V
  - 102dB SNR ('A' weighted) @ 2.9V
- ADC
  - 85dB SNR ('A' weighted) @ 1.7V
- Sampling Frequency
  - DAC: 8-96kHz
  - ADC: 8-24kHz

#### **High Efficiency Headphone Amplifier**

- volume control via serial interface
- 32 steps @1.5dB and MUTE
- 2x12mW @16Ω driver capability@ 1.8V supply
- THD -74dB @16Ω; 1.8V
- 2x40mW @16Ω driver capability@ 3.6V supply
- THD -77dB @16Ω; 3.6V
- headphone and over-current detection
- phantom ground eliminates large capacitors
- ground noise cancellation

#### **Line Output**

- volume control via serial interface
- 32 steps @1.5dB and MUTE
- 0.6Vp @10kΩ, 1.8V
- ground noise cancellation

#### **Microphone Input**

- 3 gain pre-setting (30dB/36dB/42dB) and AGC
- 32 gain steps @1.5dB and MUTE
- supply for electret microphone
- microphone detection
- remote control by switch

#### 2 Line Inputs

- volume control via serial interface
- 32 steps @1.5dB and MUTE
- stereo or 2x mono

#### **Audio Mixer**

- 8 channel input/output mixer with AGC
- mixes line inputs, microphone and ADC with DAC
- left and right channels independent

#### **Power Management**

#### **Voltage Generation**

- step down for CPU core (0.61V-3.35V, 250mA)
- step down for peripheral (0.61V-3.35V, 250mA)
- LDO1 for AFE supply (1.7V (1.65-3.2V), 50mA)
- LDO2 for AFE supply (2.7V (2.3-3.5V), 200mA)
- LDO3 for peripherals (1.2V-3.5V, 100/200mA)
- LDO4 for peripherals (1.2V-3.5V, 100/200mA)
- VBUS comparator
- separate input for LDO3
- power supply supervision & hibernation modes
- 5sec and 10sec emergency shut-down

#### **Backlight Driver**

- step up for backlight (15V (25V))
- current control mode (1.2-37.2mA)
- voltage control mode
- 2 HV current sinks
- automatic dimming
- over-voltage protection

#### **Battery Charger**

- automatic trickle charge (55mA)
- prog. constant current charging (55-460mA)
- prog. constant voltage charging (3.9V-4.25V)
- current limitation for USB mode
- integrated battery switch

#### General

#### Supervisor

- automatic battery monitoring with interrupt generation and selectable warning level
- automatic temperature monitoring with interrupt generation and selectable warning and shutdown levels

#### **Real Time Clock**

- ultra low power 32kHz oscillator
- 32bit RTC sec counter, 96 days auto wake-up
- selectable interrupt (seconds or minutes)
- 128bit free SRAM for random settings
- 32kHz clock output to peripheral
- voltage generation
- trim able oscillator
- <1uA total power consumption</p>

#### **Auxiliary Oscillator (system clock generation)**

- low power 12-24MHz oscillator
- clock output

#### **General Purpose ADC**

- 10bit resolution
- 22 inputs analog multiplexer

#### Interfaces

- 2 wire serial control interface
- reset pin with selectable delay, power good pin
- 64bit unique ID (OTP)
- 26 different interrupts
- Package CTBGA68 [6.0x6.0x1.1mm] 0.5mm pitch

# 3 Applications

Portable Digital Audio/Video Player and Recorder PDA, Smartphone

Figure 1. Block Diagram

# **5 Absolute Maximum Ratings**

Stresses beyond those listed in Table 3 may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in Electrical Characteristics on page 11 is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. The device should be operated under recommended operating conditions.

Table 3. Absolute Maximum Ratings

| Parameter  | Min       | Max                  | Units | Comments  |
|--|-----------|----------------------|-------|---|
| 5V pins  | -0.5      | 7.0                  | V     | Applicable for pins BVDD, BVDDC1,<br>BVDDC2, BVDDR, BVDDP1,<br>BVDDBSW, CHGIN, CHGOUT, VBUS,<br>CSCL, CSDA, PWRUP |
| 3V pins  | -0.5      | 5.0                  | V     | Applicable for pins DVDD, HPVDD,<br>FVDD, VDD17IN, RVDD, VPRG1,<br>VPRG2, VPRG3                                   |
| 15V pins   | -0.5      | 17                   | V     | Applicable for pin SW15V, ISINK1/2  |
| Voltage difference at VSS terminals                | -0.5      | 0.5                  | V     | Applicable for pins VSS, VSS15V, CVSS12, HPVSS, AVSS, DVSS  |
| 3.3V pins with protection to AVDD27                | -0.5      | 5.0<br>AVDD27        | V     | Applicable for pins BATTEMP, HPGND  |

# 8 Detailed Description - Audio Functions

## 8.1 Audio Line Inputs (2x)

#### 8.1.1 General

The chip features two identical line inputs. The blocks can work in 2x mono single ended or in stereo single ended mode

The volume control has an independent gain regulation for left and right channel with 32 steps @ 1.5dB each and MUTE. The gain can be set from –40.5dB to +6dB. The stage is set to mute by default. If the line input is not enabled, the volume settings are set to their default values. Changing the volume and mute control can only be done after enabling the input.

Line Input 1 and 2 are sharing one gain stage.

Figure 3. Line Inputs

#### 8.1.2 Parameter

AVDD17=1.7V, AVDD27=2.7V,  $T_A$ = 25 $^{\circ}$ C, unless otherwise mentioned

Table 7. Line Input Parameter

| Symbol           | Parameter                 | Condition  | Min   | Тур          | Max          | Unit       |
|------------------|---------------------------|--|-------|--------------|--------------|------------|

#### 8.1.3 Register Description

Table 8. Line Input Related Register

| Name      | Base          | Offset | Description   |
|-----------|---------------|--------|---|
| LINE_IN_R | 2-wire serial | 0Ah    | Right Line Input 1/2 settings, Line Input 2 selection |
| LINE_IN_L | 2-wire serial | 0Bh    | Left Line Input 1/2 settings                          |
| AudioSet1 | 2-wire serial | 14h    | Enable/disable driver stage                           |
| AudioSet3 | 2-wire serial | 16h    | Enable/disable mixer input                            |

Line input has to be enabled in register 14h first before other settings in register 0Ah and 0Bh can be programmed.

#### 8.2 Microphone Input

#### 8.2.1 General

The AFE offers one microphone input and one low noise microphone voltage supply (microphone bias), voice activation, microphone connect detection and push button remote control.

Figure 4. Microphone Input

#### 8.2.2 Gain Stage & Limiter

The integrated pre-amplifier allows 3 preset gain settings. There is also a limiter which attenuates high input signals from e.g. electret microphones signal to 1Vp. The AGC has 128 steps with 0.375dB with a dynamic range of the full pre-amplifier level. The AGC is ON by default but can be disabled by a microphone register bit.

Apart from the microphone pre-amplifier the microphone input signal can further be amplified with 32 @1.5dB programmable logarithmic gain steps and MUTE. All gains and MUTE are independently programmable. The gain can be set from -40.5dB to +6dB.

The stage features a soft-start function. Pre-amplifier and gain-stage settings can be set before enabling the microphone stage. After enabling the stage to gain is automatically set to the defined value by using the 128 steps of the AGC.

#### 8.2.3 Supply & Detection

Each microphone input generates a supply voltage of 1.5V above HPCM. The supply is designed for ≤2mA and has a 6.5mA current limit. In OFF mode the MICS terminal is pulled to AVDD with 20kOhm. A current of typically 50uA generates an interrupt to inform the CPU, that a circuit is connected. When using HPCM as headset ground the HP–stage gives the interrupt. After enabling the HP-stage through the CPU the microphone detection interrupt will follow.

When using the MICS terminal as ADC-10 input to monitor external voltages the 20kOhm pull-up has to be disabled by disabling the interrupt for microphone detection.

#### 8.2.4 Remote Control

Fast changes of the supply current of typically 500uA are detected as a remote button press, and an interrupt is generated. Then the CPU can start the measurement of the microphone supply current with the internal 10-bit ADC to distinguish which button was pressed. As the current measurement is done via an internal resistor, only two buttons generating a current of about 0.5mA and 1mA can be detected. With this, 1mA as microphone bias is still available.

#### 8.2.5 Voice Activation

Further a built-in voice activation comparator can actuate an interrupt if microphone input voltage of about 5mVRMS is detected.

#### 8.2.6 Parameter

AVDD17=1.7V, AVDD27=2.7V, T<sub>A</sub>= 25<sup>o</sup>C unless otherwise mentioned *Table 9. Microphone Input Parameter*

#### 8.3 Line Output

#### 8.3.1 General

The line output is designed to provide the audio signal with a typical  $V_{PEAK}$  level at a load of minimum  $10k\Omega$ , which is a minimum value for line inputs. If the limiters (N20/N21) are deactivated the peak output voltage is AVDD17/2 Vp.

This AFE has a combined output stage for headphone and line output with an independent gain regulation for left and right channel with 32 steps @ 1.5dB each. The gain can be set from -40.5dB to +6dB.

If the line output is not enabled, the volume settings are set to their default values. Changing of volume and mute control can only be done after enabling the output.

Figure 5. Line Output

#### 8.3.2 Auto Fading

By setting a new output volume level, the stage does a automatic fading from the current gain setting to the new target. Changing the input multiplexer from one source to another will be done by fadeing out to mute, source changing and fading in of the new source to the target volume. Change from HPH-out to LINE-out is done by fading out of HPH-out to mute and fading in of the LINE-out to the target volume.

The fading speed can be programmed to 3 different speed levels. The immediate response can be selected as 4th state.

#### 8.3.3 Ground Noise Cancelation

A separate ground input allows to connect a ground sense line direct from the dock connector ground or line out jack shield to make the audio output independent from PCB ground noise.

#### 8.3.4 Parameter

AVDD17=1.7, AVDD27=2.7,  $T_A$ = 25  $^{\circ}$ C, unless otherwise mentioned

Table 11. Line Output Parameter

# 8.4 Headphone Output

The headphone output is designed to provide the audio signal with 2x40mW @  $16\Omega$  or 2x20mW @  $32\Omega$ , which are typical values for headphones.

This AFE has a combined output stage for headphone and line output with an independent gain regulation for left and right channel with 32 steps @ 1.5dB each. The gain can be set from -40.5dB to +6dB.

Figure 6. Headphone Output

#### 8.4.1 Phantom Ground

There are 2 ways to connect a headphone to the AFE. In order to spare the bulky ac/dc de-coupling capacitors at pins HPR/HPL a buffered ground (Phantom Ground) is provided. This Common Mode Buffer needs to be switched on if utilized. If form factor considerations are less stringent, the headphones can be conventionally connected via 2x200µF capacitors.

Figure 7. Headphone Output using Common Mode Buffer

#### 8.4.2 No-Pop Function

The output is automatically set to mute when the output stage is disabled.

To avoid Pop-Click noise during power-up and shut-down of the headphone amplifier, a charge/discharge control of HPGND (0V-HPVDD/2-0V) at pins HPR/HPL is incorporated into the AFE. The 470nF capacitor at pin HPGND is used to form the charge/discharge slope. Pls observe that pin HPGND is a high impedance node which must not be connected to any other external device than the 470nF buffer capacitor. To avoid Pop-Click noise one has to wait for 750ms in between a power-down (switch-off) and a power-up (switch-on) of the headphone amplifier.

#### 8.4.3 Auto Fading

By setting a new output volume level, the stage does a automatic fading from the current gain setting to the new target. Changing the input multiplexer from one source to another will be done by fading out to mute, source changing and fading in of the new source to the target volume. Change from HPH-out to LINE-out is done by fading out of HPH-out to mute and fading in of the LINE-out to the target volume.

The fading speed can be programmed to 3 different speed levels. The immediate response can be selected as 4th state.

Figure 8. Headphone Startup with MaxGain Settings

Figure 9. Headphone Change Gain Settings

#### 8.4.4 Headphone Detection

When the headphone amplifier is powered down, one can detect the connection of a headset. It only work if the headset is connected between pins HPR/HPL and HPCM. As long as the headphone amplifier is powered down, HPCM is biased to 150mV and acting as the sense pin. There is a corresponding interrupt available to be enabled.

#### 8.4.5 Over-current Protection

The headphone amplifier has an over-current protection (e.g. HPR/HPL is shorted). This over-current protection will power down the headphone amplifier for a programmable time-out period (512ms, 0ms). There is a corresponding interrupt available to be enabled.

Figure 10. Headphone Overcurrent OFF-ON Sequence

#### 8.4.6 Ground Noise Cancelation

As separate ground input allows to connect a ground sense line direct from the dock connector ground or headphone jack shield to make the audio output independent from PCB ground noise.

#### 8.4.7 Power Options

To save power, especially when driving 32 Ohm loads, a reduction of the bias current is selected. For 16Ohm loads the bias current can be increased.

#### 8.4.8 Parameter

AVDD17=1.7, AVDD27=2.7, HPVDD = 2.7V, T<sub>A</sub>= 25°C, unless otherwise mentioned *Table 13. Headphone Output Parameter*

#### 8.5 DAC, ADC and I2S Digital Audio Interface

#### 8.5.1 Input

The AFE receives serialized audio data for the DAC via pin SDI. The output of the DAC is fed through a volume control to the mixer stage and to the multiplexers of line output and headphone amplifiers or direct to these output stages.

This serialized audio data is a digital audio data stream with the left and the right audio channels multiplexed into one bit-stream. Via pin LRCK the alignment clock is input to the DAC digital filters. LRCK (Left Right Clock) indicates whether the serial bit-stream received via pin SDI, represents right channel or left channel audio data. Via pin SCLK the bit clock for the serial bit-stream is signalled. SDI and LRCK are synchronous with SCLK. SDI, LRCK and SCLK are inputs; SDO is not used.

The volume control has an independent gain regulation for left and right channel with 32 steps @ 1.5dB each. The gain can be set from -40.5dB to +6dB. The stage is set to mute by default. If the DAC input is not enabled, the volume settings are set to their default values. Changing the volume and mute control can only be done after enabling the input.

#### **8.5.2** Output

This block consists of an audio multiplexer where the signal, which should be recorded, can be selected. The output is then fed through a volume control to the audio ADC. The digital output is done via an I2S interface.

The AFE sends serialized audio data from the ADC via pin SDO. This serialized audio data is a digital audio data stream with the left and the right audio channels multiplexed into one bit-stream. Via pin LRCK the alignment clock is signalled to the connected devices (e.g. CPU). LRCLK (Left Right Clock) indicates whether the serial bit-stream sent via pin SDI, presents right channel or left channel audio data. Via pin SCLK the bit clock for the serial bit-stream is signalled. SDO and LRCK are synchronous with SCLK. SDO is an output; LRCK and SCK are inputs; SDI is not used.

The volume control has an independent gain regulation for left and right channel with 32 steps @ 1.5dB each. The gain can be set from –34.5dB to +12dB. The stage is set to mute by default. If the ADC output is not enabled, the volume settings are set to their default values. Changing the volume and mute control can only be done after enabling the input.

The I2S output uses the same clocks as the I2S input. The sampling rate therefore depends also on the input sampling rate. The exact ratio can be set in register 11h.

The SDO output can be configured to operate in push/pull (3 different driver strengths) or to be tri-state. For a more detailed description of the GPIO functionality of this pin please refer to chapter GPIO Pins on page 50.

#### 8.5.3 I2S Modes

The AFE can be operated either in Slave Mode or in Slave Mode with the master clock directly signalled via pin MCLK. The master clock (MCLK) is the necessary internal over-sampling clock for the DAC and ADC (e.g. 128\*fs, fs=audio sampling frequency)

In Slave Mode the PLL generates the master clock based on LRCK. Thus the PLL needs to be preset to the expected sampling frequency. The ranges are 8kS-23kS (8kHz-23kHz) and 24kS-48kS (24kHz-48kHz). Please refer to register 1A-7h.

Figure 11. I2S Modes

#### 8.5.4 Clock Supervision

The digital audio interface automatically checks the LRCK. An interrupt can be generated when the state of the LRCK input changes. A bit in the interrupt register represents the actual state (present or not present) of the LRCK.

#### 8.5.5 Signal Description

The digital audio interface uses the standard I2S format:

- left justified
- MSB first
- one additional leading bit

The on-chip synchronization circuit allows any bit-count up 32bit. When there are less than 18 bits sampled, the data sample is completed with "0"s. In I2S direct mode the data length has to be minimum 18 bits.

The ADC output is always 14 bit. If more SCLK pulses are provided, only the first 14 will be significant. All following bits will be "0".

SCLK has not to be necessarily synchronous to LRCK but the high going edge has to be separate from LRCK edges. The LRCK signal has to be derived from a jitter-free clock source, because the on-chip PLL is generating a clock for the digital filter, which has to be always in correct phase lock condition to the external LRCK.

Please observe that LRCK has to be activated before enabling the ADC.

Figure 12. I2S left justified mode

#### 8.5.6 Parameter

DVDD=2.9V, TA=25℃, Slave Mode, f s=48kHz, MCLK = 128\*fs, unless otherwise specified *Table 15. I2S Timing*

#### 8.5.7 Register Description

Table 16. Audio Converter Related Register

| Name       | Base          | Offset | Description   |
|------------|---------------|--------|---|
| DAC_R      | 2-wire serial | 0Eh    | DAC input volume settings                               |
| DAC_L      | 2-wire serial | 0Fh    | DAC input volume settings                               |
| ADC_R      | 2-wire serial | 10h    | ADC output volume settings, source multiplexer settings |
| ADC_L      | 2-wire serial | 11h    | ADC output volume settings, sampling rate settings      |
| DAC_IF     | 2-wire serial | 11h    | DAC input digital volume settings                       |
| AudioSet1  | 2-wire serial | 14h    | Enable/disable DAC, DAC gain stage & ADC                |
| AudioSet3  | 2-wire serial | 16h    | Enable/disable mixer input                              |
| Out_Cntr3  | 2-wire serial | 1A-3h  | Control of SDO signal and drive                         |
| PLL        | 2-wire serial | 1A-7h  | PLL sample rate settings                                |
| PMU_Enable | 2-wire serial | 1Ch    | Enables writings to extended registers 1Ah-3 and 1Ah-7  |
| IRQENRD_1  | 2-wire serial | 25h    | Interrupt settings for LRCK changes                     |

DAC and ADC have to be enabled in register 14h first before other settings in register 0Eh to 11h can be programmed.

#### 8.6 Audio Output Mixer

#### 8.6.1 General

The mixer stage sums up the audio signals of the following stages

- Microphone Input 1
- Line Input 1/2
- DAC Output
- ADC Input

The mixing ratios have to be set within the volume registers of the corresponding input stages. Please be sure that the peak voltage of input signals for the mixer stage is less than AVDD17/3. If summing up several signals, each individual signal has of course to be accordingly lower. This shall insure that the output signal is also not higher than AVDD17/3 peak to get a proper signal for the output amplifier.

This stage features an automatic gain control (AGC), which automatically avoids clipping.

#### 8.6.2 Register Description

Table 17. Audio Mixer Related Register

| Name      | Base          | Offset | Description   |
|-----------|---------------|--------|---|
| AudioSet2 | 2-wire serial | 15h    | Enable/disable mixer stage and AGC                    |
| AudioSet3 | 2-wire serial | 16h    | Enable/disable DAC, MIC or Line Inputs to mixer stage |

#### 8.7 2-Wire-Serial Control Interface

#### 8.7.1 General

There is an I2C slave block implemented to have access to 64 byte of setting information.

The I2C address is: Adr\_Group8 - audio processors

- 8Ch\_write
- 8Dh\_read

#### 8.7.2 Protocol

Table 18. 2-Wire Serial Symbol Definition

| Symbol   | Definition   | RW                         | Note             |  |  |  |

|          | AS3543 (=slave) transmits data                         |                            |                  |  |  |  |

Figure 13. Byte Write

Figure 14. Page Write

Byte Write and Page Write formats are used to write data to the slave.

The transmission begins with the START condition, which is generated by the master when the bus is in IDLE state (the bus is free). The device-write address is followed by the word address. After the word address any number of data bytes can be sent to the slave. The word address is incremented internally, in order to write subsequent data bytes on subsequent address locations.

For reading data from the slave device, the master has to change the transfer direction. This can be done either with a repeated START condition followed by the device-read address, or simply with a new transmission START followed by the device-read address, when the bus is in IDLE state. The device-read address is always followed by the 1st register byte transmitted from the slave. In Read Mode any number of subsequent register bytes can be read from the slave. The word address is incremented internally.

Figure 15. Random Read

Random Read and Sequential Read are combined formats. The repeated START condition is used to change the direction after the data transfer from the master.

The word address transfer is initiated with a START condition issued by the master while the bus is idle. The START condition is followed by the device-write address and the word address.

In order to change the data direction a repeated START condition is issued on the 1st SCL pulse after the acknowledge bit of the word address transfer. After the reception of the device-read address, the slave becomes the transmitter. In this state the slave transmits register data located by the previous received word address vector. The master responds to the data byte with a not-acknowledge, and issues a STOP condition on the bus.

Figure 16. Sequential Read

Sequential Read is the extended form of Random Read, as more than one register-data bytes are transferred subsequently. In difference to the Random Read, for a sequential read the transferred register-data bytes are responded by an acknowledge from the master. The number of data bytes transferred in one sequence is unlimited (consider the behavior of the word-address counter). To terminate the transmission the master has to send a not-acknowledge following the last data byte and generate the STOP condition subsequently.

Figure 17. Current Address Read

To keep the access time as small as possible, this format allows a read access without the word address transfer in advance to the data transfer. The bus is idle and the master issues a START condition followed by the Device-Read address. Analogous to Random Read, a single byte transfer is terminated with a not-acknowledge after the 1st register byte. Analogous to Sequential Read an unlimited number of data bytes can be transferred, where the data bytes has to be responded with an acknowledge from the master. For termination of the transmission the master sends a not-acknowledge following the last data byte and a subsequent STOP condition.

# 9 Detailed Description - Power Management Functions

## 9.1 Low Drop Out Regulators

#### 9.1.1 General

These LDOs are designed to supply sensitive analogue circuits, audio devices, AD and DA converters, micro-controller and other peripheral devices. The design is optimized to deliver the best compromise between quiescent current and regulator performance for battery powered devices.

Stability is guaranteed with ceramic output capacitors of  $1\mu F$  +/-20% (X5R) or  $2.2\mu F$  +100/-50% (Z5U). The low ESR of these caps ensures low output impedance at high frequencies. Regulation performance is excellent even under low dropout conditions, when the power transistor has to operate in linear mode. Power supply rejection is high enough to suppress high ripple on the battery at the output. The low noise performance allows direct connection of noise sensitive circuits without additional filtering networks. The low impedance of the power device enables the device to deliver up to 150mA even at nearly discharged batteries without any decrease of performance.

Figure 19. LDO Block Diagram

#### 9.1.2 LDO1

This LDO generates the audio supply voltage used for the AFE itself.

- Input voltage is VDD17IN
- Output voltage is AVDD17 (typ. 1.7V)
- Driver strength: 50mA

It is set to a default output voltage of 1.7V, 50mA<sub>max</sub>. It supplies the analog audio blocks of the AFE. Additional external loads are possible but most not exceed the supply ratings in total together with the operating internal blocks. Further the external load must not induce noise to the sensitive AVDD17 supply pin.

#### 9.1.3 LDO2

This LDO generates the digital and audio supply voltage used for the AFE itself.

- Input Voltage is BVDD
- Output Voltage is AVDD27 (typ. 2.7V)
- Driver strength: 100mA, can be programmed to 200mA

It is set to a default output voltage of 2.7V, 100mA<sub>max</sub>. It supplies the digital part of the AFE as well as all audio switches and multiplexers. Additional external loads are possible but most not exceed the supply ratings in total together with the operating internal blocks. Further the external load must not induce noise to the AVDD27 supply pin but is not as critical as AVDD17.

#### 9.1.4 LDO3 & LDO4

These LDOs can be used to generate the periphery voltage for the digital processor or other external components (e.g. ext. DAC, USB-PHY, SD-Cards, NAND-Flashes, FM-Tuner ...)

LDO3 has a separate input pin (BVDDP1) which can be connected to either the battery or a DCDC converter output.

- Input Voltage BVDDP1 or BVDD
- Output Voltage is PVDD1 & PVDD2 (1.2 to 3.5V)
- Default value at start-up is defined by VPRG2 pin
- Driver strength: 100mA, can be programmed to 200mA

#### 9.1.5 Parameter

BVDD=3.6V,  $T_A$ = 25 $^{o}$ C, unless otherwise mentioned

## 9.2 DCDC Step-Down Converter (2x)

#### 9.2.1 General

These converters are meant to convert the battery voltage down to voltages which fit to the core and peripheral supply voltage requirements for microprocessors.

- input Voltage BVDDC1/2 (usually connected to the battery)
- output Voltage CVDD1 & CVDD2
- output voltage levels can be programmed independently form 0.61V to 3.35V
- the default value at start-up is defined by VPRG1 and VPRG2 pin
- DVM for both outputs with selectable timings
- driver strength 250mA
- under- and over-voltage detection

Figure 21. DCDC Step-Down Block Diagram

#### 9.2.2 Functional Description

The step-down converter is a high efficiency fixed frequency current mode regulator. By using low resistance internal PMOS and NMOS switches efficiency up to 97% can be achieved. The fast switching frequency allows using small inductors, without increasing the current ripple. The unique feedback and regulation circuit guarantees optimum load and line regulation over the whole output voltage range, up to an output current of 250mA, with an output capacitor of only  $10\mu F$ . The implemented current limitation protects the DCDC and the coil during overload condition.

To achieve optimized performance in different applications, adjustable settings allow to compromise between high efficiency and low input, output ripple:

#### Low ripple, low noise operation:

In this mode there is no minimum coil current necessary before switching off the PMOS. As result, the ON time of the PMOS will be reduced down to tmin\_on at no or light load conditions, even if the coil current is very small or the coil current is inverted. This results in a very low ripple and noise, but decreased efficiency, at light loads, especially at low input to output voltage differences. In the case of an inverted coil current the regulator will not operate in pulse skip mode.

Figure 22. DCDC buck with disabled current force / pulse skip mode

#### 1: LXC1 voltage, 2:coil current (1mV=1mA) 3: output voltage

#### High efficiency operation:

In this mode there is a minimum coil current necessary before switching off the PMOS. As result, fewer pulses at low output loads are necessary, and therefore the efficiency at low output load is increased. On the other hand the output voltage ripple increases, and the noisy pulse skip operation is on up to a higher output current.

Figure 23. DCDC buck with enabled current force / pulse skip mode

#### 1: LXC1 voltage, 2:coil current (1mV=1mA) 3: output voltage

It's also possible to switch between these two modes dynamically during operation:

#### 100% PMOS ON mode for low dropout regulation:

For low input to output voltage difference the DCDC converter can use 100% duty cycle for the PMOS transistor, which is than in LDO mode. This feature is enabled if the output voltage drops by more than 4%.

#### 9.2.3 Parameter

BVDD=3.6,  $T_A$ = 25 $^{\circ}$ C, unless otherwise mentioned

Table 22. DCDC Parameter

| Symbol               | Parameter                | Condition  | Min      | Тур               | Max | Unit |

### 9.3 15V Step-Up DCDC Converter

#### 9.3.1 General

The integrated Step-Up DC/DC Converter is a high efficiency current-mode PWM regulator, providing an output voltage up to 15V. A constant switching-frequency results in a low noise on supply and output voltages.

It has two programable high voltage current sinks (1.2 to 37.2mA) for driving e.g. white LEDs as back-light. It can drive also unbalanced strings due to the internal automatic feedback selection.

A voltage feedback mode allows generating constant supply voltages for e.g. OLEDs by using an external Zener diode. To bias the diode ISINK1 is sinking about 50uA in this voltage feedback mode.

An internal protection circuit will shut down the regulator if the voltage on SW15 exceeds 15V. No more external protection has to be used to avoid an exceeding of the operation conditions in a no load situation.

### 9.3.2 Dimming

The DCDC booster together with the current sinks has an adjustable automatic logarithmic dimming for a smooth ON/OFF transition. It is also possible to control the dimming with an external signal via a GPIO pin. PWGD, Q24M or Q32K pin can be selected as input for the external dimming signal.

#### 9.3.3 Current Sink Only Mode

The current sinks are normally only working when the DCDC booster is switched on, but can also be activated separately. To do so reg. 1Bh-1 has to be set to 08h (select external dimming), and reg. 1Ah-4 has to be set to xxxx xx00b (no ext. dimming source selected).

### 9.4 Charger

#### 9.4.1 General

This block can be used to charge a 4V Li-Ion accumulator. It supports constant current and constant voltage charging modes with adjustable charging currents (55 to 460mA) and maximum charging voltage (3.9 to 4.25V).

An internal protection circuit will limit the charging current when a CHGIN voltage drop is detected.

For the end of charge current four levels can be selected while the battery temperature shutdown has two temperature levels to choose from.

The current battery voltage as well as the actual charging current can be measured with the general purpose ADC.

Figure 27. Charger Block Diagram

Figure 28. Charger States

### 9.4.2 Soft Charge

If the battery and therefore CHGOUT is below 3V the charger is working in a fixed soft charge mode with the smallest possible charging current of 55mA and 3.9V charger end voltage. After reaching the 3V level the charger switches to the register defined mode and sets the programmed charging current and voltage.

### 9.4.3 End of Charge Detection

For the EOC level 4 presets can be selected. This makes it possible to monitor the charging progress also during constant voltage mode. If the EOC level is reached an interrupt can be generated, but it is also possible to poll the charger status bits at any time.

#### 9.4.4 Temperature Supervision

This charger block also features a 15uA supply for an external 100k NTC resistor to measure the battery temperature while charging. If the temperature is too high, an interrupt can be generated. If the battery temperature drops the charger will start charging again. The levels for switching off/on the charger  $(45/42^{\circ}\text{C} \text{ or } 55/50^{\circ}\text{C})$  can be selected via register settings.

If the NTC resistor does not have  $100k\Omega$  its value can be corrected with a resistor in series or in parallel.

#### 9.4.5 Parameter

AVDD27=2.7, T<sub>A</sub>= 25°C, unless otherwise mentioned

Table 26. Charger Parameter

| Symbol                 | Parameter               | Condition                            | Min                       | Тур              | Max                       | Unit |

### 9.5 Battery Switch

#### 9.5.1 General

An integrated battery switch provides a battery separation during charging. In normal battery operation the switch is closed. With an ideal diode function a smooth transition between the different modes are guaranteed.

Figure 29. Battery Switch Modes

In normal operation, when the charger is not connected, all the system current comes out of the battery

If the system current (red) plus the charger current (yellow) is higher than the maximum available current from USB or wall adapter, V<sub>IN</sub> will drop.

If it comes close to 4.5V the charger will automatically reduce the charging

If it comes close to 4.5V the charger will automatically reduce the charging current, which will bring up  $V_{_{\rm IN}}$  to its nominal voltage again.

During charging the battery switch opens and the system is supplied direct from the charger input.

If the system current (red) is higher than the max, available current from e.g. USB, than the additional needed current will be provided from the battery. To ensure a smooth transition an ideal diode will provide the current till the battery switch closes.

This ideal diode function will also ensure a smooth switchback to battery operation, when the USB or wall adapter connector is plugged out.

## 10 Detailed Description - SYSTEM Functions

### 10.1 SYSTEM

#### 10.1.1 General

The system block handles the power up, power down and regulator voltage settings of the AFE.

The PWGD and XRES outputs can be configured to operate in push/pull (2 different driver strengths) open-drain mode or to be tri-state. For a more detailed description of the GPIO functionality of these pins please refer to chapter GPIO Pins on page 50.

### 10.1.2 Power Up/Down Conditions

The chip powers up when one of the following condition is true:

Table 28. Power UP Conditions

| # | Source      | Description  |
|---|-------------|--|
| 1 | PWRUP PwUp  | ON_KEY High Level at PRWUP pin of >= 1/3 BVDD      |
| 2 | CHGIN PwUp  | Charger Plug-In High level at CHGIN pin of >= 4.0V |
| 3 | VBUS PwUp   | USB Plug-In High level at VBUS pin of >= 4.5V      |
| 4 | WAKEUP PwUp | Wake-Up Timer power-up on RTC clock                |
| 4 | MCLK PwUp   | ON_KEY High Level at MCLK pin of >= 1/3 BVDD       |

The chip automatically shuts off if one of the following conditions arises:

Table 29. Power DOWN Conditions

| #  | Source               | Description   |
|----|----------------------|---|
| 1  | SERIF MAJOR PwDn     | Power-Down by SERIF writing 0h to register 20h                      |
|    |                      | This Power-Down clears wake-up as well.                             |
| 2  | Emergency PwDn       | Power-Down if PWRUP pin is HIGH for 10sec.                          |
| _  | Linergoney 1 WDII    | This time can be reduced to 5sec with bit 7 in register 21h.        |
|    |                      | write 4h to reg. 1Ch and 0h to reg. 1Ah disable heartbeat source    |
| 3  | Wake-Up PwDn         | Write 3 times to reg.22h to define wake-up time;                    |
|    |                      | Power-Down by heartbeat without source by writing 9h to reg. 20h    |
|    |                      | write 4h to reg. 1Ch and 4h/8h or Ch to reg. 1Ah select HBT source  |
| 4  | Heartbeat PwDn       | write 9h to reg. 20h enable heartbeat with source                   |
|    |                      | Power-Down if no edge on the selected HBT source is seen for 500ms. |
| _  | SERIF Watch-Dog      | write 3h to reg. 20h enable SERIF watch-dog                         |
| 5  | 5 PwDn               | Power-Down if no SERIF read is seen for 500ms.                      |
|    |                      | Power-Down if junction temperature rises up to 140degC.             |
| 6  | Junction-Temp PwDn   | This threshold can be lowered with bits <4:0> in reg 21h.           |
|    |                      | This supervisor can be disabled with bit 2 in reg. 20h.             |
| 7  | DVDD LOW DwD*        | Power-Down if AVDD27 LDO has 10% under-voltage for more than 680us. |
| /  | BVDD LOW PwDn        | This supervisor can get disabled with bit 6 in reg. 21h.            |
| 0  | DVDD4 LOW DwD        | Power-Down if enabled with bit 1 in reg. 23h and                    |
| 8  | PVDD1 LOW PwDn       | PVDD1 LDO has 10% under-voltage for more than 680us.                |
|    | 9 PVDD2 LOW PwDn     | Power-Down if enabled with bit 3 in reg. 23h and                    |
| 9  |                      | PVDD2 LDO has 10% under-voltage for more than 680us.                |
| 40 | 40 0)/DD4   0)// DwD | Power-Down if enabled with bit 7 in reg. 23h and                    |
| 10 | CVDD1 LOW PwDn       | CVDD1 DCDC has 10% under-voltage for more than 680us.               |
| 11 | CVDD3 LOW Dw.D.      | Power-Down if enabled with bit 1 in reg. 24h and                    |
| 11 | CVDD2 LOW PwDn       | CVDD2 DCDC has 10% under-voltage for more than 680us.               |

### 10.1.3 Start-up Sequence

The AFE offers different power-up sequences. While VPRG1 and VPRG2 pins are defining the regulator voltages VPRG3 is setting the sequence of powering on the regulators during the start-up. These pins detect 5 logical input states which shall come from an external resistor divider network.

At first, LDO2 (AVDD27) and LDO1 (AVDD17) are powered up. This cannot be influenced with the selection of specific sequences below. LDO2 is necessary for the internal supply of the AFE, LDO1 could be turned off later if no audio functionality is needed.

After power-up sequence all voltage settings and power on/off conditions of the described regulators can be programmed via the serial interface

Table 30. Start-Up Sequence

|                      | CVDD1           | CVDD2           | PVDD1           | PVDD2           |
|----------------------|-----------------|-----------------|-----------------|-----------------|
| VPRG1 (core)         |                 |                 |                 |                 |
| vdd                  | 0.8V            |                 |                 |                 |
| 150k PU <sup>1</sup> | 1.5V            |                 |                 |                 |
| open                 | 1.2V            |                 |                 |                 |
| 150k PD <sup>2</sup> |                 |                 |                 |                 |
| vss                  | 1.0V            |                 |                 |                 |
| VPRG2 (peri)         |                 |                 |                 | 1. 99           |
| vdd                  |                 | 2.5V            | 3.3V            | 3.3V            |
| 150k PU              |                 | 2.8V            | 1.8V            | 3.3V            |
| open                 |                 | 1.8V            | 3.3V            | 3.3V            |
| 150k PD              |                 |                 |                 |                 |
| VSS                  |                 | 3.3V            | 3.3V            | 3.3V            |
| VPRG3 (sequence      | e)              |                 |                 | •               |
| vdd                  | 1 <sup>st</sup> | 2 <sup>nd</sup> | 3 <sup>rd</sup> | off             |
| 150k PU              | 1 <sup>st</sup> | 2 <sup>nd</sup> | 3 <sup>rd</sup> | 3 <sup>rd</sup> |
| open                 | 3 <sup>rd</sup> | 2 <sup>nd</sup> | 1 <sup>st</sup> | 1 <sup>st</sup> |
| 150k PD              |                 |                 |                 |                 |
| vss                  | 3 <sup>rd</sup> | 2 <sup>nd</sup> | 1 <sup>st</sup> | off             |

<sup>1.</sup> pull ups (PU) must be connected to AVDD27

### 10.1.4 XRES delay with PWGD pin

With using an exteral capacitor on PWGD, the XRES signal can be delayed. This delay can be calculated with the 10uA pull-up current and a comparator threshold of ~1V. Using a 100nF capacitance will give a delay of 10ms.

<sup>2.</sup> pull downs (PD) shall be connected to DVSS

### 10.1.5 Register Description

Table 31. System Related Register

| Name       | Base          | Offset | Description  |
|------------|---------------|--------|--|
| Out_Cntr1  | 2-wire serial | 1A-1h  | Control of PWGD and XRES signal and drive                |
| In_Cntr    | 2-wire serial | 1A-4h  | Selection of HBT input pin                               |
| PMU_Enable | 2-wire serial | 1Ch    | Enables writings to extended registers 1Ah-1 and 1Ah-5   |
| SYSTEM     | 2-wire serial | 20h    | Watchdog and Over-temperature control, Power down enable |
| SUPERVISOR | 2-wire serial | 21h    | Set emergency shutdown time                              |
| IRQENRD_0  | 2-wire serial | 23h    | Enable/disable PMU interrupts                            |
| IRQENRD_1  | 2-wire serial | 24h    | Enable/disable wake-up, voice and PMU interrupts         |
| IRQENRD_2  | 2-wire serial | 25h    | Enable/disable charger, USB and supervisor interrupts    |
| IRQENRD_3  | 2-wire serial | 26h    | Enable/disable junction temperature interrupt            |

### 10.2 Hibernation

#### 10.2.1 General

Hibernation allows shutting down a part or the complete system. Hibernation can be terminated by every possible interrupt of the AFE. E.g. one can use the RTC for a time triggered wake-up. The interrupt has to be enabled before going to hibernation.:

Table 32. Hibernation

| State       | Description  |
|-------------|--|
| Enter       | To enter hibernation mode the following settings have to be done:  - Enable just these IRQ sources which should lead to leave hibernation mode.  - Make sure that IRQ is inactive (IRQ flags get cleared by Reg0x23-27 readings.  - Define which regulators should be kept powered and enter hibernation by writing to Reg 1Ch_0x06 + Reg 17h_0xXX  Note that hibernation will shutdown regulators which are not in the keep list of the mentioned Reg 17h writing and which are powered by the selected power-up sequence.  (e.g. PVDD2 will not go hibernation with VPRG3 is vss or vdd) |
| Hibernation | VDD27 chip supply is kept ON All other regulators are switched OFF dependent on the KEEP-Bits XRES goes active and PWGD goes inactive.   |
| Leave       | The chip will come out of Hibernation with IRQ activation. Start-Up sequence is provided defined by the VPRG state latched on the previous Start-Up. (VPRG state does not get latched again by leaving hibernation)  |

### 10.2.2 Register Description

Table 33. Hibernation Related Register

| Name        | Base          | Offset | Description                                 |
|-------------|---------------|--------|---|
| Hibernation | 2-wire serial | 17h-6  | Hibernation control                         |
| PMU_Enable  | 2-wire serial | 1Ch    | Enables writings to extended register 17h-6 |

### 10.3 Supervisor

#### 10.3.1 General

This supervisor function can be used for automatic detection of BVDD brown out or junction over-temperature condition.

#### 10.3.2 BVDD Supervision

The BVDD supervision interrupt level is set to 175mV above regulator output AVDD27. When BVDD reaches this level an interrupt can be generated.

If AVDD27 reaches the "programmed level of AVDD27" -10% for more than 680us, the AFE shuts down automatically if the shutdown is not disabled.

### 10.3.3 Junction Temperature Supervision

The temperature supervision level can also be set by 5 bits (120 to –15°C). If the temperature reaches this level, an interrupt can be generated. The over-temperature shutdown level is always 20°C higher.

### 10.3.4 Power Rail Monitoring

The 4 main regulators as well as the DCDC15 booster and the system supply AVDD27 have an extra monitor which observes the output voltage of the regulators. This power rail monitors are independent from the 10bit ADC. To activate these please see related registers. For a shut down the voltage of the regulator has to be 10% or more below the programmed value for more than 680us.

#### 10.3.5 Register Description

Table 34. Supervisor Related Register

| Name       | Base          | Offset | Description  |
|------------|---------------|--------|--|
| SUPERVISOR | 2-wire serial | 21h    | Low battery shutdown disable and junction temperature supervision threshold levels |
| IRQENRD_0  | 2-wire serial | 23h    | Enable/disable PVDD/CVDD monitoring interrupt and shutdown                         |
| IRQENRD_1  | 2-wire serial | 24h    | Enable/disable PVDD/CVDD monitoring interrupt and shutdown                         |
| IRQENRD_2  | 2-wire serial | 25h    | Enable/disable battery brown out interrupt   |
| IRQENRD_3  | 2-wire serial | 26h    | Enable/disable junction temperature interrupt                                      |
| IRQENRD_4  | 2-wire serial | 27h    | Enable/disable AVDD27 and DCDC15 monitoring interrupt                              |

### 10.4 Interrupt Generation

### 10.4.1 General

All interrupt sources can get enabled or disabled by corresponding bits in the 5 IRQ-bytes. By default no interrupt source is enabled.

The XIRQ output can be configured to operate in push/pull (2 different driver strengths), open-drain mode or to be tristate. The signal polarity can be defined as active-low or active-high. Default state is open-drain active-low. For a more detailed description of the GPIO functionality of this pin please refer to chapter GPIO Pins on page 50.

#### 10.4.2 IRQ Source Interpretation

There are 3 different modules to process interrupt sources:

#### LEVEL

The IRQ output is kept active as long as the interrupt source is present and this IRQ-Bit is enabled

### **EDGE**

The IRQ gets active with a high going edge of this source. The IRQ stays active until the corresponding IRQ-Register gets read.

#### STATUS CHANGE

The IRQ gets active when the source-state changes. The change bit and the status can be read to notice which interrupt was the source. The IRQ stays active until the corresponding interrupt register gets read.

#### 10.4.3 De-bouncer

There is a de-bounce function implemented for USB and CHARGER. Since these 2 signals can be unstable for the phase of plug-in or unplug, a de-bounce time of 512ms/256ms/128ms/8ms can be selected by 2 bits in the IRQ\_ENRD\_4 register (27h).

### 10.4.4 Interrupt Sources

26 IRQ events will activate the XIRQ pin:

- Headphone connected
- Headphone over-current
- Microphone connected
- Microphone remote control
- Voice activation threshold reached
- RTC sec/min elapsed
- 10bit ADC end of conversion
- I<sup>2</sup>S changed (active/inactive)
- USB changed (connect/disconnect)
- Charger changed (end of charge or connect/disconnect)
- Battery temperature high (at 45°C or 55°C with 100kΩ NTC)
- Junction temperature high
- RTC watchdog (e.g. after battery was changed)
- Battery low (Brown-out voltage reached)
- Wake-up from hibernation
- Power-up key (pin PWRUP) pressed
- Power rail monitor: over-voltage PVDD1, PVDD2, CVDD1, CVDD2, DCDC15
- Power rail monitor: under-voltage PVDD1, PVDD2, CVDD1, CVDD2, AVDD27

### 10.4.5 Register Description

Table 35. Interrupt Related Register

| Name                   | Base          | Offset | Description   |
|------------------------|---------------|--------|---|
| Out_Cntr3              | 2-wire serial | 1A-3h  | Control of XIRQ signal, polarity and drive  |
| PMU_Enable             | 2-wire serial | 1Ch    | Enables writings to extended register 1Ah-3 and 1Ah-5                                     |
| IRQENRD_0              | 2-wire serial | 23h    | Enable/disable PMU interrupts   |
| IRQENRD_1              | 2-wire serial | 24h    | Enable/disable wake-up, voice and PMU interrupts  |
| IRQENRD_2              | 2-wire serial | 25h    | Enable/disable charger, USB and supervisor interrupts                                     |
| IRQENRD_3 2-wire seria |               | 26h    | Enable/disable junction temperature, headphone, microphone and I2S interrupt              |
| IRQENRD_4              | 2-wire serial | 27h    | Enable/disable PMU, RTC, ADC10 and microphone interrupt, set VBUS and CHGIN debounce time |

### 10.5 Real Time Clock

#### 10.5.1 General

The real time clock block is an independent block, which is still working even when the chip is shut down. The only condition for this operation is that BVDDR has a voltage of above 1.0V. The block uses a standard 32kHz crystal that is connected to a low power oscillator. The total power consumption is typ. 650nA. (Q32K clock buffer not operating)

An internal supply switch will supply the RTC as long as possible form the Li-Ion battery and only switch to BVDDR if the main battery is empty or has been removed.

The RTC seconds counter is 32bit wide and can be programmed via the 2-wire serial interface. The RTC can deliver a second or minute interrupt.

Another 23bit wide counter allows auto wake-up (max. after 96 days). This counter is internally connected to the power-up and hibernation control block.

The RTC voltage regulator (RVDD) further supplies a 128bit SRAM. It can be used to store settings or data before shutdown.

The Q32K output can be configured to operate in push/pull (3 different driver strengths) or to be trie-state. For a more detailed description of the GPIO functionality of this pin please refer to chapter GPIO Pins on page 50.

#### 10.5.2 Clock Adjustment

The RTC clock is adjustable in steps of 7.6ppm which allows the use of inexpensive 32kHz crystals. The nominal frequency shall be 32.768Hz. This frequency is divided down to 0.25Hz: f = 32.768 / (4\*32\*1024)

At the input of this divider one can add corrective counts, which allow to correct an inaccurate crystal in a range from – 64 counts (=-488ppm) to +63 counts (=+480ppm):

fcorrected = fcrystal / [(4\*32\*1024)-64+RTC\_TBC]

### 10.5.3 Register Description

Table 36. RTC Related Register

| Name           | Base          | Offset        | Description   |  |  |  |
|----------------|---------------|---------------|---|--|--|--|
| RAM & WakeUp   | 2-wire serial | 19h           | RTC wake-up settings and SDRAM access                       |  |  |  |
| Out_Cntr2      | 2-wire serial | 1A-2h         | Control of Q32K signal and drive                            |  |  |  |
| PMU_Enable     | 2-wire serial | 1Ch           | Enables writings to extended register 1Ah-2                 |  |  |  |
| IRQENRD_2      | 2-wire serial | 25h           | Interrupt settings for RVDD under-voltage detection         |  |  |  |
| IRQENRD_4      | 2-wire serial | 27h           | Interrupt settings for getting a second or minute interrupt |  |  |  |
| RTC_Cntr       | 2-wire serial | 28h           | RTC oscillator and counter enable, free usable bits         |  |  |  |
| RTC_Time       | 2-wire serial | 29h           | RTC interrupt and time correction settings                  |  |  |  |
| RTC_0 to RTC_3 | 2-wire serial | 2Ah to<br>2Dh | RTC time-base seconds registers                             |  |  |  |

### 10.6 10-Bit ADC

### 10.6.1 General

This general purpose ADC can be used for measuring several voltages and currents to perform functions like battery monitor, temperature supervision, button press detection, etc.

### 10.6.2 Input Sources

Table 37. ADC10 Input Sources

| # | Source   | Range           | LSB | Description  |  |  |  |
|---|----------|-----------------|-----|--|--|--|--|
| 0 | BVDD     | 5.120V          | 5mV | check main system input voltage  |  |  |  |
| 1 | BVDDR    | 5.120V          | 5mV | check RTC backup battery voltage   |  |  |  |
| 2 | CHGIN    | 5.120V          | 5mV | check charger input voltage  |  |  |  |
| 3 | CHGOUT   | 5.120V          | 5mV | check battery voltage of 4V Li-Ion accumulator   |  |  |  |
| 4 | VBUS     | 5.120V          | 5mV | check USB input voltage  |  |  |  |
| 5 |          | 5.120V          | 5mV | Source defined by DC_TEST in register 18h  |  |  |  |
| 6 | BatTemp  | 2.048V          | 2mV | check battery charging temperature   |  |  |  |
| 7 |          |                 |     | reserved   |  |  |  |
| 8 | MICS     | 2.048V          | 2mV | check voltage on MICS for remote control or external voltage measurement                     |  |  |  |
| 9 |          |                 |     | reserved   |  |  |  |
| Α | I_MICS   | 1.024mA<br>typ. | 2uA | check current of MICS for remote control detection   |  |  |  |
| В |          |                 |     | reserved   |  |  |  |
| С | VBE_1uA  | 1.024           | 1mV | measuring basis-emitter voltage of temperature sense transistor; Tj = (674 - ADC10<9:0>) / 2 |  |  |  |
| D | VBE_2uA  | 1.024           | 1mV | measuring basis-emitter voltage of temperature sense transistor; Tj = (694 - ADC10<9:0>) / 2 |  |  |  |
| Е | I_CHGact | 1.024V          | 1mV | check active charger current   |  |  |  |
| F | I_CHGref | 1.024V          | 1mV | check reference charger current  |  |  |  |

### 10.6.3 Parameter

AVDD27=2.7,  $T_A$ = 25 $^{\circ}$ C, unless otherwise mentioned

Table 38. ADC10 Parameter

| Symbol              | Parameter               | Condition | Min | Тур  | Max | Unit |
|---------------------|-------------------------|-----------|-----|------|-----|------|
| ADC <sub>FS</sub>   | ADC Full Scale Range    |           |     | 2.16 |     | V    |
| T <sub>CON</sub>    | Conversion Time         |           | -   | 34   | 50  | μs   |
| I_MIC <sub>FS</sub> | I_MICS Full Scale Range |           | 0.7 | 1.0  | 1.4 | mA   |

### 10.6.4 Register Description

Table 39. ADC10 Related Register

| Name       | Base                      | Offset | Description  |  |  |  |
|------------|---------------------------|--------|--|--|--|--|
| PMU_Enable | 2-wire serial             | 1Ch    | Extended ADC source selection                      |  |  |  |
| IRQENRD_4  | 2-wire serial             | 27h    | Interrupt settings for end of conversion interrupt |  |  |  |
| ADC10_0    | ADC10_0 2-wire serial 2Eh |        | ADC source selection, ADC result<9:8>              |  |  |  |
| ADC10_1    | 2 wire serial             | 2Fh    | ADC result <7:0>                                   |  |  |  |

#### 10.7 GPIO Pins

#### 10.7.1 General

PWGD, XRES, Q24M, Q32K, SDO, XIRQ are so called GPIO (general purpose inputs/outputs) as they can feature auxiliary functionality.

If the main pin function is not needed all pins can provide internal clocks or can drive a static HIGH or LOW. Four different clock lines (CLKINT1, CLKINT2, CLK24M, CLK32K) can be selected. Each of these clock lines can drive different frequencies which can be set by register options. In addition some pins can provide a PWM signal. The duty cycle of the PWM output can also be set in the registers.

PWGD, XRES and XIRQ can be configured also as open drain outputs. For all pins the driver strength of the push/pull output mode can be selected.

PWGD, Q24M, Q32K can also be used as inputs for a heartbeat signal or an external dimming signal for the DCDC15 booster.

#### 10.7.2 Internal Source Signals

#### CLKINT1 Signal

This is an internal signal line which can drive pre defined frequencies of 125Hz, 1kHz, 667kHz or 2MHz. This signal line can be selected as source for the XRES, Q24M, Q32K, XIRQ and SDO GPIO output pins.

### CLKINT2 Signal

This is an internal signal line which can drive the PLL clock, the clock for the logarithmic dimming of DCDC15 or can be set to static HIGH/LOW. This signal line can be selected as source for the PWGD, Q24M, Q32K and XIRQ output pins.

#### CLK24M Signal

This is an internal signal line which is driving the 12-24MHz oscillator output clock per default, but can be set to drive this clock divided by 2 or 4. The forth option is to deactivate the 12-24MHz oscillator.

#### CLK32K Signal

This is an internal signal line which is driving the 32kHz oscillator output clock per default, but can be set to drive also a 1Hz signal as well as a a static HIGH/LOW.

### PWM Signal

The duty cycle of the PWM signal can be set in 128 steps plus an option to invert the signal. It ca be used as source for all GPIO outputs other than XIRQ.

#### 10.7.3 Pin Functions

#### PWGD Pin

Can drive CLK24M, CLKINT2 or the PWM signal as auxiliary function. The output can be configured to operate in push/pull (2 different driver strength) open-drain mode or to be trie-state. It can be used as an input for a heartbeat, external dimming signal or as additional source for the 10-bit general purpose ADC.

Using a capacitor on this pin will delay the XRES signal. Please refer to chapter XRES delay with PWGD pin on page 44. When usig the pin as an ADC input the voltage to be measurted has to be higher than 1V, the XRES delay functionality is than no longer avilable.

#### XRES Pin

Can drive CLK32K, CLKINT1 or the PWM signal as auxiliary function. The output can be configured to operate in push/pull (2 different driver strengths) open-drain mode or to be trie-state.

The XRES signal can be delayed by using a capacitor on PWGD pin. Please refer to chapter XRES delay with PWGD pin on page 44.

#### Q24M Pin

Can drive CLKINT1, CLKINT2 or the PWM signal as auxiliary function. The output can be configured to operate in push/pull (3 different driver strengths) or to be trie-state. It can be used as an input for a heartbeat or external dimming signal.

#### Q32K Pin

Can drive CLKINT1, CLKINT2 or the PWM signal as auxiliary function. The output can be configured to operate in push/pull (3 different driver strengths) or to be trie-state. It can be used as an input for a heartbeat or external dimming signal.

#### XIRQ Pin

Can drive CLKINT1, CLKINT2 signal as auxiliary function. The output can be configured to operate in push/pull (2 different driver strengths) open-drain mode or to be trie-state. The interrupt signal polarity can be defined as active-low or active-high.

#### SDO Pin

Can drive CLK24M, CLKINT1 or the PWM signal as auxiliary function. The output can be configured to operate in push/pull (3 different driver strengths) or to be trie-state.

### 10.7.4 Register Description

Table 40. GPIO Related Register

| Name       | Base          | Offset | Description  |  |  |  |
|------------|---------------|--------|--|--|--|--|
| Out_Cntr1  | 2-wire serial | 1A-1h  | Control of PWGD and XRES signal and drive              |  |  |  |
| Out_Cntr2  | 2-wire serial | 1A-2h  | Control of Q32K signal and drive                       |  |  |  |
| Out_Cntr3  | 2-wire serial | 1A-3h  | Control of XIRQ signal, polarity and drive             |  |  |  |
| In_Cntr    | 2-wire serial | 1A-4h  | Selection of HBT and DCDC 15 dimming input pin         |  |  |  |
| Clk_Cntr   | 2-wire serial | 1A-5h  | Selection of clock source or drive level for GPIO pins |  |  |  |
| PWM_Cntr   | 2-wire serial | 1A-6h  | PWM duty cycle and polarity settings                   |  |  |  |
| PMU_Enable | 2-wire serial | 1Ch    | Enables writings to extended registers 1Ah-1 to 1Ah-6  |  |  |  |

### 10.8 12-24MHz Oscillator

#### 10.8.1 General

This oscillator can be used to generate a system clock for e.g. a microprocessor if needed. It is not needed for any other AFE function. As the oscillator is default ON, it has to be disabled if not needed.

### 10.8.2 Register Description

Table 41. 12-24MHz Oscillator Related Register

| Name       | Base          | Offset | Description  |
|------------|---------------|--------|--|
| Clk_Cntr   | 2-wire serial | 1A-5h  | Enable/disable oscillator and clock divider settings |
| PMU_Enable | 2-wire serial | 1Ch    | Enables writings to extended registers A1Ah-5        |

### 10.9 Unique ID Code (64 bit OTP ROM)

### 10.9.1 General

This fuse array is used to store a unique identification number, which can be used for DRM issues. The number is generated and programmed during the production process.

### 10.9.2 Register Description

Table 42. UID Related Register

| Name           | Base          | Offset     | Description               |
|----------------|---------------|------------|---------------------------|
| UID_0 to UID_7 | 2-wire serial | 38h to 3Fh | Unique ID register 0 to 7 |

Table 70. Out\_Cntr3 Register

| Name          |                 |   |        | Base  | Default                                  |  |
|---------------|-----------------|---|--------|---|--|--|
| Out_Cntr3     |                 |   |        | 2-wire serial   | 00h                                      |  |
|               |                 | SDO and XIRQ Output Control Register  |        |   |  |  |
| Offset: 1Ah-3 |                 | This is an extended register and needs to be enabled by writing 011b to Reg This register is reset at a AVDD27-POR. |        |   | abled by writing 011b to Reg. 1Ch first. |  |
| Bit           | Bit Name        | Default   | Access | Bit Description   |  |  |
| 7:6           | DRIVE_SDO<1:0>  | 00  | R/W    | Sets the SDO output pin to push-pull or tri-state and sets various driving strengths  00: 6mA push-pull output  01: HiZ, stri-state  10: 2mA push-pull output  11: 1mA push-pull output   |  |  |
| 5:4           | MUX_SDO<1:0>    | 00  | R/W    | Multiplexes various digital signals to the SDO output pin <b>00: SDO, serial data output of the audio ADC</b> 01: CLK24M, 24MHz oszillator output 10: CLKINT1, internal clock signal, see Clk_Cntr regsiter 11: PWM, PMW_Cntr register                        |  |  |
| 3:2           | DRIVE_XIRQ<1:0> | 00  | R/W    | Sets the XIRQ output pin to open-drain, push-pull or tri-state and sets various driving strengths  00: 6mA open-drain output  01: 6mA push-pull output  10: 1mA push-pull output  11: HiZ, stri-state   |  |  |
| 1:0           | MUX_XIRQ<1:0>   | 00  | R/W    | Multiplexes various digital signals to the XRES output pin 00: XIRQ, active low interrupt request signal 01: CLKINT1, internal clock signal, see Clk_Cntr regsiter 10: CLKINT2, internal clock signal, see Clk_Cntr regsiter 11: IRQ, active low reset signal |  |  |

Table 71. In\_Cntr Register

| Name          |                 |   |        | Base   | Default |  |  |
|---------------|-----------------|---|--------|--|---------|--|--|
| In_Cntr       |                 |   |        | 2-wire serial  | 00h     |  |  |
|               |                 | HBT and Dimming Input Control Register  |        |  |         |  |  |
| Offset: 1Ah-4 |                 | This is an extended register and needs to be enabled by writing 100b to Reg. 1Ch first. This register is reset at a AVDD27-POR. |        |  |         |  |  |
| Bit           | Bit Name        | Default   | Access | Bit Description  |         |  |  |
| 7:4           | - ^ _           | 0000  | n/a    |  |         |  |  |
| 3:2           | MUX_HBT<1:0>    | 00  | R/W    | Selects the HBT (heartbeat) input pin  00: OFF, heartbeat input deactivated  01: PWGD pin  10: Q24M pin  11: Q32k pin  |         |  |  |
| 1:0           | MUX_ExtDim<1:0> | 00  | R/W    | Selects the input pin for external dimming of the DCDC15  00: OFF, no pin selected In this mode the current sinks can be used without enabling the DCDC15. ExtDim_ON bit has to be set in DCDC15 register.  01: PWGD pin 10: Q24M pin 11: Q32k pin |         |  |  |

Table 72. Clk\_Cntr Register

|          | Name          |         |        | Base  | Default                                  |  |  |
|----------|---------------|---------|--------|---|--|--|--|
| Clk_Cntr |               |         |        | 2-wire serial 00h   |  |  |  |
|          |               |         |        | Clock Control Register  |  |  |  |
|          | Offset: 1Ah-5 |         | -      | gister and needs to be enact a AVDD27-POR.  | abled by writing 101b to Reg. 1Ch first. |  |  |
| Bit      | Bit Name      | Default | Access | E   | Bit Description                          |  |  |
| 7:6      | CLKINT2<1:0>  | 00      | R/W    | Selects the CLKINT2 input source. Note, this is an internal clock, which can be multiplexed to one of the GPIO ouptus <b>00: CLKPLL, internal PLL clock</b> 01: CLKlogdim, clock used for dimming the DCDC15 10: LOW, drives the signal to logic "0" 11: HIGH, drives the signal to logic "1" |  |  |  |
| 5:4      | CLKINT1<1:0>  | 00      | R/W    | Selects the CLKINT1 frequency. Note, this is an internal clock which can be multiplexed to one of the GPIO ouptus.  00: 2MHz 01: 887kHz 10: 1kHz 11: 125Hz  |  |  |  |
| 3:2      | CLK24M<1:0>   | 00      | R/W    | Selects the CLK24M frequency, clock of 24MHz oszillator  00: OSC24MHz, oszillator frequency  01: OSC24MHz_div2, oszillator frequency divided by 2  10: OSC24MHz_div4, oszillator frequency divided by 4  11: OSC24MHz_PD, OSC24M is set to power down   |  |  |  |
| 1:0      | CLK32k<1:0>   | 00      | R/W    | Selects the CLK32k fred<br>00: OSC32kHz, RTC os<br>01: 1Hz<br>10: LOW, drives the sign<br>11: HIGH, drives the sign   | nal to logic "0"                         |  |  |

Table 73. PWM\_Cntr Register

| Name     |                |         |        | Base  | Default                                  |  |  |
